

Appendix DD

Selected Trout Streams

Class I, Class II, and Segments of Class III Trout Stream Systems Where Aspen will not be Regenerated Within 450 feet of the System

The term “selected,” as referenced in the forestwide Standards and Guidelines, is used to designate those trout streams which will have the 450-foot no-aspen-regeneration zone. These streams were selected based on trout classification, fisheries surveys, habitat surveys, water temperature, water quality and habitat improvement investments. Fish and water professionals from the Forest Service and Wisconsin Department of Natural Resources selected the trout streams that either produced or had the best potential to produce a high quality brook trout dominated coldwater ecosystem.

The Wisconsin Department of Natural Resources classifies all the State’s Trout waters using the Trout Stream Classification of Class I, II, or III. The following definitions are taken from “Wisconsin Trout Streams,” WDNR, pub 6-3600 (2002 update).

CLASS I: These are high quality trout waters, and have sufficient natural reproduction to sustain populations of wild trout at or near carrying capacity. Consequently, streams in this category require no stocking of hatchery trout.

CLASS II: Streams in this classification may have some natural reproduction, but not enough to utilize available food and space. Therefore, stocking is required to maintain a desirable sport fishery.

CLASS III: These waters are marginal trout habitat with no natural reproduction occurring. They require annual stocking of trout to provide trout fishing.

Ranger District	Stream System	Trout Class	Distance (ft) with no Aspen Regen
Park Falls	Foulds	I/II	450
	Elk	I/II	450
	Newman/Camp 4	II/III	450
Medford	Mink	II	450
Great Divide	Venison	II	450
	18 Mile	I	450
	20 Mile	I	450
	Marengo	I/II	450
	Spring Brook	I	450
